

# Monthly water situation report: East Anglia

## 1 Summary - March 2023

Overall, March was a very wet month which exceptionally high levels of rainfall across most hydrological areas. In most hydrological areas, March 2023 rainfall ranked in the top five wettest on record, with most getting more than double the amount of the LTA rainfall. Longer term rainfall continues to show a north/east to south/west split, with the south and west getting more than the north and east. As a result of this Heavy rainfall, SMD levels have decreased across the area and now back to normal levels for the time of year. Furthermore, river flows improved at all sites during March with the majority now being at normal levels or higher. There is a few indicator sites in the northeast of the area still at lower than normal levels, which are in line with the longer term rainfall patterns. The majority of groundwater indicator sites showed recharge during March (varying levels) and as a result most are now at normal levels or higher. Again, like river indicator sites, there is a few sites in the northeast of the area at less than normal levels, ranging from exceptionally low to below normal. Finally, reservoir levels improved at most sites, with most now being at or above their operational curve.

### 1.1 Rainfall

Overall, March was a very wet month, with rainfall varying between 163% to 256% of the LTA rainfall. This meant that rainfall was classified as exceptionally high in all hydrological areas except North Norfolk where rainfall was classified as notably high. On average, the area received 99mm of rain, over double the LTA of 46mm. Furthermore, the majority of hydrological areas ranked in the top five wettest March's on record, with a few areas in the northeast ranking just outside the top five. Following the wet March, the 3-month total is now showing normal to above normal levels, with a north/east to south/west split, with the above normal levels being in the south and west of the region. The 6-month total shows rainfall ranging from normal to exceptionally high levels, with the lowest rainfall being seen in the northeast of the region. Finally, the 12-month total shows notably low to normal levels, again with a north/east to south/west split, with the notably low and below normal levels being in the north and west of the region.

### 1.2 Soil moisture deficit and recharge

Following an exceptionally dry February, SMD levels had been increasing across the area and was at above normal to notably high levels for the year. As a result of the exceptionally wet March, SMD levels have been decreasing throughout March and have ended the month at normal levels for the time of year (very nearly at below normal levels). In most of the region, SMD is now between 0mm to 10mm, with a few areas having SMD between 10mm and 20mm.

### **1.3 River flows**

Following an exceptionally wet March, river flows have increased at all monitoring sites across the area since the February water situation report. As of the end of March, river flows at the monitoring sites varies between 28% to 255% of the LTA; meaning classification range from notably low to exceptionally high for the time of year. There are three sites at notably low to below normal levels, these are all found in the northeast of the region where both March's rain and longer term rain has been less than the other areas of the region. For the remaining 18 sites, 7 are at normal levels, 6 at above normal levels, 4 at notably high levels and one at exceptional high levels. The majority of normal levels are seen in the north/east of the region with the higher flows mostly being found in the south and west of the region (following pattern of longer term rainfall).

### **1.4 Groundwater levels**

Following the exceptionally wet March, the vast majority of groundwater sites have shown recharge during March, although at varying levels. There is a handful of sites that didn't show recharge during March, this is likely a delayed impact of the dry February and the impact of March's rainfall will be seen during April. The groundwater classifications show a real mixed bag with classifications ranging from exceptionally low to exceptionally high for the time of year. As of the end of March, 1 site is exceptionally low levels, 1 is notably low levels, 4 are at below normal levels, 7 are at normal levels, 2 are at above normal levels, 1 at notably high levels and 1 at exceptionally high levels. The groundwater levels seen follow the long term rainfall patterns with lowest classification generally being seen in the north and east and the higher levels being seen in the south and west.

### **1.5 Reservoir stocks**

As a result of the wet March and increasing river levels during the month, reservoir stocks have substantially improved at most sites, with most now being at or above their operational curve. The only exception is Grafham, where levels didn't really improve during March and the reservoir remains below the normal operational curve.

### **1.6 Environmental impact**

During March, only 1 pump has been in operation in the area, this was at Dungenham Farm on the Lodes Granta Support scheme. This pump was switched on in the latter half of the month, and remains in operation. All other pumps on the Lodes grant and all other schemes haven't been used during March. In March there was 42 flood alerts and 0 flood warnings in the East Anglia region.

## 1.7 Forward Look

### .1.7.1 Probabilistic ensemble projections for river flows at key sites

**June 2023:** Most sites are showing an increased probability of normal flows. The Ivel is showing an increased probability of greater than normal flows whilst Stiffkey is showing a greatly increased probability of notably low flows.

**September 2023:** Bedford Ouse, Kym, Ouse and Ivel are all showing a reduced probability of lower than normal flows. Gipping is in line with the expected probability whilst both Ely Ouse and Stiffkey show an increased probability of lower than normal flows.

### .1.7.2 Probabilistic ensemble projections for groundwater levels in key aquifers

**September 2023:** Most sites are showing an increased probability of normal levels. Smeeham is showing an increased probability of greater than normal levels whilst Bircham Newton is showing an increased probability of notably low levels.

**March 2024:** Most sites are in line with the expected probability. Therfield and Smeeham are both showing an increased probability of greater than normal levels whilst Bircham Newton is showing an increased probability of below normal levels.

# 7 Forward Look

## 7.1 Forward Look – Probabilistic ensemble projection of river flows at key sites in June 2023

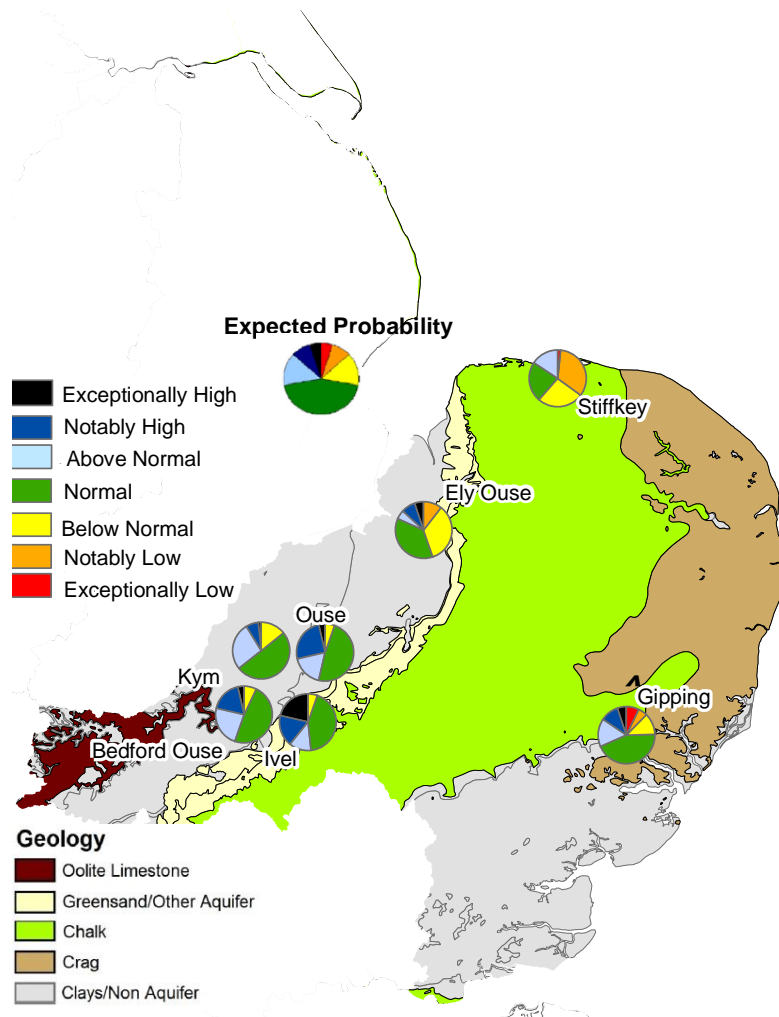

Exceptionally high or low levels are those which would typically occur 5% of the time within the historic record. Notably high or low levels are those which would typically occur 8% of the time. Above normal or below normal levels are those which would typically occur 15% of the time. Normal levels are those which would typically occur 44% of the time within the historic record.

Pie charts indicate probability, based on climatology, of the surface water flow at each site being e.g. exceptionally low for the time of year. (Source: Centre for Ecology and Hydrology, Environment Agency) Geological map reproduced with kind permission from UK Groundwater Forum, BGS © NERC. Crown copyright. All rights reserved. Environment Agency, 100026380, 2023.

## 7.2 Forward Look – Probabilistic ensemble projection of river flows at key sites in September 2023

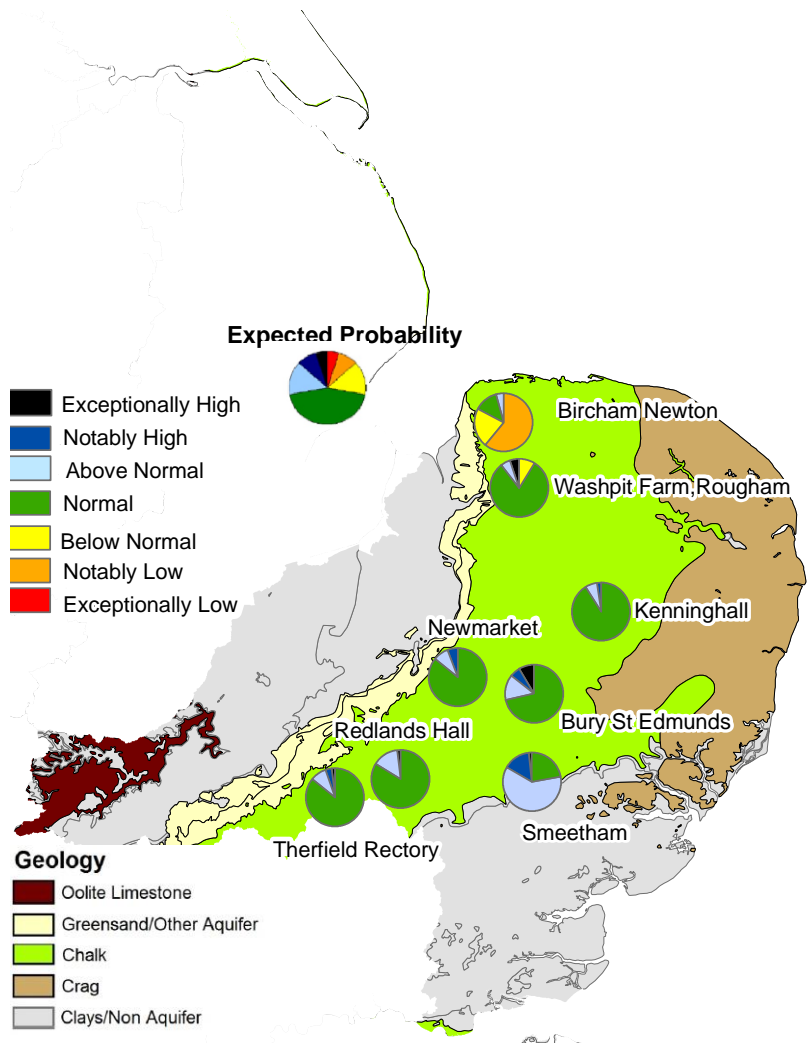

Exceptionally high or low levels are those which would typically occur 5% of the time within the historic record. Notably high or low levels are those which would typically occur 8% of the time. Above normal or below normal levels are those which would typically occur 15% of the time. Normal levels are those which would typically occur 44% of the time within the historic record.

## 8 Glossary

### 8.1 Terminology

#### **Aquifer**

A geological formation able to store and transmit water.

#### **Areal average rainfall**

The estimated average depth of rainfall over a defined area. Expressed in depth of water (mm).

#### **Artesian**

The condition where the groundwater level is above ground surface but is prevented from rising to this level by an overlying continuous low permeability layer, such as clay.

#### **Artesian borehole**

Borehole where the level of groundwater is above the top of the borehole and groundwater flows out of the borehole when unsealed.

#### **Cumecs**

Cubic metres per second ( $\text{m}^3\text{s}^{-1}$ ).

#### **Effective rainfall**

The rainfall available to percolate into the soil or produce river flow. Expressed in depth of water (mm).

#### **Flood alert and flood warning**

Three levels of warnings may be issued by the Environment Agency. Flood alerts indicate flooding is possible. Flood warnings indicate flooding is expected. Severe flood warnings indicate severe flooding.

#### **Groundwater**

The water found in an aquifer.

### **Long term average (LTA)**

The arithmetic mean calculated from the historic record, usually based on the period 1961 to 1990. However, the period used may vary by parameter being reported on (see figure captions for details).

### **mAOD**

Metres above ordnance datum (mean sea level at Newlyn Cornwall).

### **MORECS**

Met Office Rainfall and Evaporation Calculation System. Met Office service providing real time calculation of evapotranspiration, soil moisture deficit and effective rainfall on a 40 by 40 km grid.

### **Naturalised flow**

River flow with the impacts of artificial influences removed. Artificial influences may include abstractions, discharges, transfers, augmentation and impoundments.

### **NCIC**

National Climate Information Centre. NCIC area monthly rainfall totals are derived using the Met Office 5 km gridded dataset, which uses rain gauge observations.

### **Recharge**

The process of increasing the water stored in the saturated zone of an aquifer. Expressed in depth of water (mm).

### **Reservoir gross capacity**

The total capacity of a reservoir.

### **Reservoir live capacity**

The capacity of the reservoir that is normally usable for storage to meet established reservoir operating requirements. This excludes any capacity not available for use (for example, storage held back for emergency services, operating agreements or physical restrictions). May also be referred to as 'net' or 'deployable' capacity.

### **Soil moisture deficit (SMD)**

The difference between the amount of water actually in the soil and the amount of water the soil can hold. Expressed in depth of water (mm).

## 8.2 Categories

### **Exceptionally high**

Value likely to fall within this band 5% of the time.

### **Notably high**

Value likely to fall within this band 8% of the time.

### **Above normal**

Value likely to fall within this band 15% of the time.

### **Normal**

Value likely to fall within this band 44% of the time.

### **Below normal**

Value likely to fall within this band 15% of the time.

### **Notably low**

Value likely to fall within this band 8% of the time.

### **Exceptionally low**

Value likely to fall within this band 5% of the time.

## 9 Appendices

### 9.1 Rainfall table

| Hydrological area     | Mar 2023 rainfall % of long term average 1961 to 1990 | Mar 2023 band      | Jan 2023 to March cumulative band | Oct 2022 to March cumulative band | Apr 2022 to March cumulative band |
|-----------------------|---|--------------------|-----------------------------------|-----------------------------------|-----------------------------------|
| Broadland Rivers      | 188   | Exceptionally High | Normal                            | Normal                            | Notably low                       |
| Cam                   | 255   | Exceptionally High | Above normal                      | Notably high                      | Normal                            |
| Central Area Fenland  | 216   | Exceptionally High | Normal                            | Above normal                      | Below normal                      |
| East Suffolk          | 204   | Exceptionally High | Normal                            | Above normal                      | Below normal                      |
| Little Ouse And Lark  | 213   | Exceptionally High | Normal                            | Above normal                      | Below normal                      |
| Lower Bedford Ouse    | 256   | Exceptionally High | Above normal                      | Exceptionally high                | Normal                            |
| North Essex           | 235   | Exceptionally High | Above normal                      | Above normal                      | Normal                            |
| North Norfolk         | 163   | Notably High       | Normal                            | Normal                            | Below normal                      |
| Nw Norfolk And Wissey | 192   | Exceptionally High | Normal                            | Normal                            | Below normal                      |

|                    |     |                    |              |              |        |
|--------------------|-----|--------------------|--------------|--------------|--------|
| South Essex        | 210 | Exceptionally High | Above normal | Above normal | Normal |
| Upper Bedford Ouse | 240 | Exceptionally High | Above normal | Notably high | Normal |
